IS ANYONE LISTENING?

Dec. 19, 2006, the FDA proposes labeling changes to over-the-counter pain relievers due to possible health complications such as liver and kidney problems.

Jan. 2004, the FDA highlights the dangers of acetaminophen and non-steroidal anti-inflammatory drugs (NSAIDs).

Facts about Acetaminophen and NSAIDs:

- *NSAID-induced disease causes at least 103,000 hospitalizations per year.*
- *Every year 16,500 arthritis patients die from NSAID-related gastrointestinal damage alone.*
- *21% of all adverse drug reactions are due to NSAID use.*
- *People over 65 have significantly higher probability of experiencing complications associated with NSAID use.*

WE HOPE YOU ARE LISTENING

Evidence now proves these medicines can have serious complications and do very little to enhance healing.

Dr. Montgomery understands the need for pain relief products, that's why we recommend Proteo-Plus as a safe alternative for pain relief and inflammation. Our bodies' natural response to inflammation is proteolytic enzymes (not ibuprofen). Use of enzymes can assist the body's natural inflammatory response and support healing. In numerous studies, proteolytic enzyme therapy was shown to be a highly effective nutritional therapy for athletic injuries, trauma, and other musculoskeletal conditions.

For acute injuries or a flare-up from chronic conditions (i.e. arthritis), Proteo-Plus is an effective safe alternative.

Ask us for an information sheet about this nutritional therapy.
